                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of an oligonucleotide, I, which is able to form a triple helix with a duplex nucleic acid (dsNA) contg. a target sequence which comprises at least one pyrimidine tract, and at least one adjacent purine tract. It is useful for therapeutic or diagnostic control of gene expression, e.g. suppression of mNA synthesis from a target gene. A specified application is targetting of RNA in the HIV-1 genome. When appropriately labelled it may also be used as a probe. Attachment of

method of the invention has cytostatic and virucide applications and may be useful for treating HPV infections or HPV-associated conditions including cervical dysplasia, cervical carcinoma, oral mucosal cancer and laryngeal cancer. Furthermore, the method may be utilised during vaccine production and gene therapy. The current sequence is that of the HPV-targeted ribozyme (Rz)-related RNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compsn. contg. 5-thiolated (Oligo-poly-)-nucleotide(s) - for treating HIV infection, AIDS and for preventing HIV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The oligomer comprises a non-thiolated (binding) homooligonucleotide region ( d(A)12 ) to promote the binding of the remaining portion of the S-thiolated oligonucleotide ( MdU 28 ) to a homopurine site of the viral genome via triple-helix formations. The oligo is used to in the treatment of HIV. See also AAQ22624-27 and AAQ25017-Q25031

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AClis and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of proponentially immortant traits and in cartie to allow selective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             economically important traits esp. In cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (ACI)5 and a (TCI)5 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellite is summarised in the sequence information of the microsatellite sequence were used to generate the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OFTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     marker gene; tumour; Kaposi's Sarcoma; peripheral blood mononuclear cell; PBMC; expressed keratin 14; TIE 1; Salioadhesin; Siglec 1; angiogenesis;
                                                                                                                                                                                                                                                 The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3-OH, 5'-OH synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT. TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, activation of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TNF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma
                                                                                                                                                                                                                                                                                                                                                                                                                      and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor and hormone dependence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining whether a treatment is effective in changing a status of a

                                                                                                                   The invention relates to a novel method for determining whether a treatment is effective in changing a status of a certain set of target cells in an individual. The method comprises obtaining a sample from an individual after intilation of the treatment; and determining whether the sample comprises an expression product of at least one marker gene. The marker gene and a proteinaceous molecule (which can bind to the protein derived from the marker gene of the invention) are useful for determining whether a treatment is effective in counteracting a tumour in an individual, especially Kaposi's Sarcoma. Peripheral blood mononuclear cell (PBMC) expressed keratin 14, TIE 1, Salioadhesin, or Sighec 1 sequences or a fully defined sequence given in the specification, or
certain set of target cells in an individual comprises determining whether the sample comprises an expression product of at least one marker
                                                                                                                                                                                                                                                                                                                                                their analogues are useful as indicators for angiogenesis and for detecting the presence of a tumour cell in an individual. The expression product of a gene comprising a marker gene of the invention is useful as a drug target. The compound is useful for preparing a medicament. This polymucleotide sequence represents a tag sequence which showed overexpression in Kaposi's Sarcoma SAGE libraries KS3 and KS4 of the

including autoimmune diseases, degenerative nervous system diseases, graft versus host diseases, hypersensitivity diseases, infectious diseases, and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections manifested in leprosy. Infectious diseases include viral infections the yeast genus Candida, parastitic infections such as those caused by schistcosmes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
                                                                                    Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                           The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.4%; Score 15; DB 1; Length 15; 100.0%; Pred. The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant compressing and treating T-cell associated diseases including autoimmune disease, degenerative nervous system diseases. Complexit diseases, hypersensitivity diseases, infectious diseases and neoplastic diseases. Hypersensitivity diseases include Multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple collections and Alzheimer and contact with allergens that lead to allergies, Type II hypersensitivities such as those contact with allergies und as those caused by viruses such as HIV, fungal infections such as those caused by viruses such as HIV, fungal infections such as those caused by chieves and bacterial infections such as those caused by chieves tillaria and bacterial infections such as those caused by chieves tillaria and bacterial infections such as those caused by Nycobacterium. Neoplastic diseases include as concer of the brain, however the allergens include as concer of the brain, however the allergens and cancers such as concered the brain, however the such as concerned the present of the brain, however the past genus caused by the contact of the brain, however the such as concerned the present of the brain, however the past genus caused by the contact of the brain, however the present of the brain, however the such as concerned the present of the brain, however the present of the present 
                                                                                                                                                                                                                                                                             Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eating disorder, polymorphism, dataset, allele, HGBASE identification, serotonin receptor 1D; delta-opioid receptor; dopamine receptor D2; anorexia nervosa; bulimia nervosa; probe; ss.

                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                The invention relates to a novel isolated nucleic acid molecule comprising a variant gene associated with an eating disorder and selected from any of 119 polymorphisms with their corresponding genotyping in dataset, alleles and HGBASE identification, given in the specification. The novel nucleic acid molecule has polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in particular ancrexia nervosa and bullania nervosa. This polynucleotide sequence represents a dopamine D2 receptor probe of the invention
                                                                                                                       nucleic acid molecule having polymorphisms in the serotonin receptor delta-opioid receptor, or dopamine receptor D2, useful in diagnostic prognostic assays for eating disorders, such as anorexia and bulimia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer; comprising a sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer. The method represents a modified fragment length polymorphism assay, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (NNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprofective; antibacterial; replication; pancreatitis; encephalltis; myocarditis; meningitis; infection; hepatitis; liver fallure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, waycarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least tenz 2-0-methyl modifications, phosphorothiadre linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocatellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecule that modulates replication of West Nile Virus

proteins and their coding sequences: MD23, MD24, MD212, MD213 sencoded at chromosome 7q22.1, MD23, sencoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease clusted as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapoulic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                               Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human zinc finger-containing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (NNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis, a condition related to WNV infection e.g. pancreatis, inverted the properties, methodicis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nuclecides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

ઠે 요 ADA99678 ID ADA9

Human MDZ3 scanning oligonucleotide SEQ ID 666.

```
New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

     The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome second in the sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder or associated with MDZ1, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                            The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reading breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ65210 - ABZ65224, ABZ65531, ABZ65210 - ABZ65224, ABZ65531, ABZ65210 - ABZ6524,
                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate

fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is a flanked at its 5'-end by degenerate nucleotides. The method represents anodified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Cellular Inhibitor of Apoptosis-1 (c-IAP-1). The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of c-IAP-1), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation, as research argaents (e.g. to distinguish between members of a biological pathway) and in kits. Sequences AAZ2215-189 represent phosphorothicate oligonucleotides used for antisense inhibition of cellular inhibitor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense compounds complementary to Cellular Inhibitor of Apoptosis-1 useful for e.g. diagnostics, therapeutics, and as research reagents.

The invention relates to a method of inducing cellular apoptosis comprising administering to a cell an effective amount of an antisense compound targeted to a nucleic acid molecule encoding human cellular inhibitor of apoptosis-1 (cIAP-1), so that expression of cIAP-1 is inhibited and apoptosis is induced. The cell used in the method is a cancer cell. The antisense compound is an antisense oligomolecide that comprises at least one modification of the internucleoside linkage, sugar moiety or nucleobase, wherein the modification is a phosphorothioate internucleoside linkage, a 2'-O-methoxyethyl sugar moiety or a 5-methylytosine nucleobase. The antisense oligomolecitide is a chimeric oligomolectide. The methods and compositions are useful for the prevention and/or treatment of diseases or conditions associated with a pherent expression or activity of human cIAP-1, such as cancer, autoimmune disorders and viral infections. This sequence represents a human cIAP-1 DNA antisense oligomolectide of the invention.
                                                                                                                                                                                                                                                                        Human; cellular inhibitor of apoptosis-1; cIAP-1; ss; cellular apoptosis; cancer; antisense oligonucleotide; phosphorothioate internucleoside linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; autoimmune disorder; viral infection; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inducing cellular apoptosis by administering an antisense modulating the human Cellular Inhibitor of Apoptosis-1, useful in preventing or treating cancer, autoimmune disorders and viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 18 BP; 4 A; 3 C; 6 G; 5 T; 0 U; 0 Other;
                                                                                                                                                                                                                                          Human cIAP-1 DNA antisense oligonucleotide #14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.4%; Scor.

The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonucleotide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylalkylamino bridges. The present sequence is an OC used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ss; SDSO; short double stranded oligonucleotide; cleavage site; viral infection; malignant tumour; genetic disease; metabolic disease; gene chip; protein chip; microarray; gene drug; Dermogene; Lungene; Hepatogene; Leukogene; Lymphogene; Prostogene; Breastogene; Braintumogene; Skin-whitogene; short interfering RNA; siRNA; cancer; RNA interference.

The invention relates to screening, identifying or predicting, and assembling 19-25 nt double-stranded oligonuclectides (termed short double stranded oligonuclectides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific DNA sequence in an abnormal gene encoding a protein with gene chip and protein chip microarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the sequence within the abnormal gene encoding a protein or playing other composition colls and protein chip microarrays, identifying a specific DNA composition of a solution of a sequence of computer and specific Software. Composition of a sesistance of computer and specific software, composition of an RNA molecule and making sure that selected sequence of software. Also included are pharmaceutical compositions of gene drugs (such as Dermogene, Lungene, Hepatogene, Leukogene, Lumpene, Lungene, Hepatogene, Lukogene, Lumpene, Lungene, Hepatogene, Lukogene, Lumpene, Lumpene, Hepatogene, Lukogene, Lumpene, Lumpene, Lumpene, Lumpene, Lumpene, Lumpene, Lukogene, Lukokogene, Lukogene, Lukokogene, L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense oligonucleotide molecules or short interfering RNA (siRNA) (comprising identifying a special pattern that can be localised in any position of an oligonucleotide sequence evaluating the specificity of a selected sequence). The Short interfering RNA (siRNA) are targeted against genes involved in viral infection, malignant tumours, genetic and metabolic diseases. The methods are useful for designing and selecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              short double-stranded oligonucleotides as a gene drug that can specifically inactivate a group of corresponding genes. The composition
                                                                                                                                                                                                                                                                                                                                                                                                                                   Designing and selecting short double-stranded oligonucleotides for treating viral infections, cancer and genetic or metabolic diseases, comprises using gene chip and protein chip microarrays to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 10; 58pp; English.

Designing and selecting short double-stranded oligonucleotides for treating viral infections, cancer and genetic or metabolic diseases, comprises using gene chip and protein chip microarrays to identify specific DNA sequences.

Claim 12; SEQ ID NO 25; 58pp; English.

The invention relates to screening, identifying or predicting, and assembling 19-25 nt double-stranded oligonucleotides (termed short double stranded oligonucleotides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific DNA sequence in an abnormal gene encoding a protein with gene chip and protein chip microarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the gene chip and protein chip microarrays, identifying a specific DNA sequence within the abnormal gene encoding a protein or playing other biological roles with the assistance of computer and specific software, considered and making sure that selected sequence is not localised within the stem-loop of target mRNA with any related software. Also included are pharmaceutical compositions of gene drugs (such as Dermogene, Iungene, Hepatogene, Leukogene, Lymphogene, Prostogene, Braintumogene and Skin-whitogene including but group of specific 19-25 nt daRNA, 19-25 nt daRNA and/or single-stranded RNA and/or DNA with the special pattern, 5'-cogened or practical pattern, 5'-cogened or pharmaceutical carifect condensation agents (or none), one or more nucleic acid condensation agents (or none), one or more predicting and selecting and activiting a materials and a simplified method for predicting and solditional specific and efficacious small double-stranded oligonucleotides (SDSO), antisense oligonucleotide molecules or short interfering RNA (SIRNA) (comprising identifying a special pattern that can be localised in any position of an oligonucleotide sequence evaluating the specificity of a selected sequence). The Short interfering RNA (siRNA) are targeted against genes involved in viral infection, malignant tumours, genetic and metaboolic diseases. The methods are useful for designing and selecting short double-stranded oligonucleotides as a gene drug that can Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; mouse; murine; ds.

TNFR1 expression modulation related antisense oligo SEQ ID No 176.

specifically inactivate a group of corresponding genes. The composition may be used for treating diseases or disorders associated with abnormal expression of genes in cells or tissues of humans or animals, such as viral infections, cancer, or genetic or metabolic diseases. The present sequence is a target region for an SDSO from an (unspecified) human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises antisense oligonucleotides that are capable of inhibiting expression of the human clusterin gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of clusterin in cells. The antisense oligonucleotides are also useful for treating an animal with a disease or condition associated with clusterin (e.g. hypercholesterolaemia; cardiovascular disorders; hypercholesterolaemia; cardiovascular disorders; hyperproliferative disorders; and hyperlipidemic disorders; The present DNA sequence represents a clusterin antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothioate backbone and also contains 2'-O-methoxyethyl wings

                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFRI), where the antisense compound inhibits expression of TNFRI. The antisense compound is useful for inhibiting the expression of TNFRI in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFRI. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFRI. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a mouse oligonucleotide relating to the TNFRI of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                            The invention comprises a gene screening method for groups with a high risk of developing cervical cancer. The gene screening method involves determining whether or not epithelial tissue cells have the integral human papilloma virus (HPV) 16.18 E6/F3 gene segment. The method of the invention may be used to screen high risk groups for cervical cancer. I present sequence represents a PCR primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for determining if an individual has a tumour cell or site of angiogenesis, or if a treatment is effective in changing angiogenesis or changing a status of a set of target cells, comprising determining if a sample of the subject has an expression product of at least one marker gene. Also described is a compound capable of altering the expression or activity of Keratin 14, TIE 1, Salioadhesin or Siglec, and kits containing them from the present invention can be used in a diagnostic method, particularly as an indicator of angiogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successfull. ABQ81816 to ABQ82006 represent nucleotide sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                   Determining presence of a tumor cell or angiogenesis, and the effectiveness of treatment, by detecting the presence of marker genes is useful to detect and monitor treatment of Karposi's Sarcoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/BBP alpha) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions. The human and/or mouse C/BBP alpha RNA, and were analysed for their effect on C/BBP alpha mRNA levels by quantitative real-time PCR. The C/BBP family of proteins are a family of transcription factors which regulate the expression of a wide range of genes that control normal tissue development, cellular function, cellular proliferation and functional differentiation. C/BBP beta (also known as C/BPBI, LAP, TCFS, CRP2, NFL6, ILGDBP, NF-M, AGP/BBP and App/CBBP) primarily regulates hormone responsiveness and oxidative stress responses and is a mediator of IL-6 (interleukin-6) signalling. C/BBP beta is thought to be involved in carbohydrate metabolism, immunity, the Thi response, female fertility and gluconeogenic pathways. C/BBP beta is expressed in the liver, lung, spleen, kidney, brain, and testis, with the liver, it is also expressed at a higher control in the lung. It is also expressed at a higher
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        level in malignant ovarian tissue compared with normal ovarian tissue, and its expression in pancreas is upregulated in response to chronically elevated levels of glucose, indicating that it is involved in the impairment of insulin secretion in type II diabetes. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with C/EBP beta expression, such as cancer (particularly ovarian cancer), tumour formation, diabetes (particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         marker gene; tumour; Kaposi's Sarcoma; peripheral blood mononuclear cell; PBMC; expressed keratin 14; TIE 1; Salioadhesin; Siglec 1; angiogenesis; drug target; tag; SAGE library; KS3; KS4; RT-PCR; primer; ss.
                                                                                                                                                                                                                     Novel antisense compound targeted to nucleic acids encoding human or mouse CCAAT/enhancer binding protein (C/BBP) beta, useful in vitro for inhibiting expression of human or mouse C/EBP beta in cells/tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

treatment is effective in changing a status of a certain set of target cells in an individual. The method comprises obtaining a sample from an individual after initiation of the treatment, and determining whether the sample comprises an expression product of at least one marker gene. The marker gene and a proteinaceous molecule (which can bind to the protein derived from the marker gene of the invention) are useful for determining whether a treatment is effective in counteracting a tumour in an individual, especially Kaposi's Sarcoma. Peripheral blood mononuclear cell (PBMC) expressed keratin 14, TIE 1, Salioadhesin, or Siglec 1 sequences or a fully defined sequence given in the specification, or their analogues are useful as indicators for anglogenesis and for their analogues are useful as indicators for anglogenesis and for their analogues. The expression product of a gene comprising a marker gene of the invention is useful as a drug target. The compound is useful for preparing a medicament. This polymucleotide sequence represents a confirmation primer of a tag

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an national antiple associated with lung and/or has antiinflammatory, antiallargic, antiasthmatic, hypotenaive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an artificial matory steroid in a subject, for reducing levels of continuous or receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of undiginant in subject; stissue, or treating bronchodilation, increasing levels of undiginal producing allarias or a consistent in a subject; stissue, or treating bronchodilation, increasing levels of undiginal producing increasing levels or consistion, lung inflammation in a subject or a consistion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule.1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of
ESM-1 related disorder; diabetes; cancer; ischaemia; reperfusion injury; angiogenic disorder; immunological disorder; cardiovascular disorder; neurological disorder; antisense technology; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound, having a sequence targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), useful for preparing composition for treating e.g., diabetes, cancer or cardiovascular

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of endothelial specific molecule-1 (ESM-1).
                                                                       /mod_base= OTHER

```
The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule. (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of

Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, antisense oligonucleotide that can be used to modulate expression of endothelial specific molecule-1 (ESM-1).
                                                                                                                                                                       gene therapy; endothelial specific molecule-1; ESM-1;
ESM-1 related disorder; diabbtes; cancer; ischaemla; reperfusion injury;
angiogenic disorder; immunological disorder; cardiovascular disorder;
neurological disorder; antisense technology; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound, having a sequence targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), useful for preparing composition for treating e.g., diabetes, cancer or cardiovascular

```

The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disporder. This sequence represents an antisense oligonuclectide that can be used to modulate expression of endothelial specific molecule-1 (ESM-1).

Sequence 20 BP; 7 A; 1 C; 5 G; 7 T; 0 U; 0 Other;

The human mPGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

antidiabetic, immunomodulator, cardiant, neuroprotective, antiantlammatory, neuroprotective, nootropic, antiantitic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGBS-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGBS-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of diagnosing or predicting susceptibility to Grohn's disease, comprising determining the presence or subsence of a disease-predisposing haplotype of a W1 variant allele and/or 266S allele at the NODZ/CARDIS locus, in an individual. The disease-predisposing haplotype further comprises a variant allele or an allele chosen from W18. WH, W17 and W18 variant allele. The disease-predisposing haplotype further comprises an allele at a single nucleotide polymorphism (SNP) chosen from SNP8, SNP12, and SNP13. The method is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing or predicting susceptibility to Crohn's disease in individual, comprises determining presence or absence of disease-predisposing haplotype comprising JWI variant allele and/or 268S allele at NOD2/CARDIS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Crohn's disease; NOD2/CARD15 locus; single nucleotide polymorphism; SNP; autoimmune disease; psoriasis; ulcerative colitis; myasthenia gravis; autoimmune gastritis; Type I diabetes; 88; primer.
inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,

Example 3; Page 28; 64pp; German.

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using a template a DNA sample containing at least one segment of (I); and cetermining the length of the resulting amplicon(s). Also described are: a method of determining (M3) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease and for prediagnosis of such diseases, especially prion diseases and for prediagnosis of such diseases, especially prion diseases but also expert (fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, continually less expensive than known methods based on sequencing. This equence represents a primer used to genotype a region of the cow prion protein (PrP) comprising a polymorphic microsatellite locus.

Sequence 25 BP; 0 A; 2 C; 0 G; 23 T; 0 U; 0 Other;

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and cetermining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and predisposition to a disease, associated with a gene that include PML. The method is used to identify microsatellite markers, in a disease and for prediagnosis of such diseases, especially prion diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion protein (PrP) comprising a polymorphic microsatellite locus.

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers pecifically priming and allowing amplification of each Vbeta gene, vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant respection and diagnosing and treating T-cell associated diseases including autoimmune disease, degenerative nervous system diseases, infectious diseases including autoimmune disease, degenerative nervous system diseases, and neoplastic disease, Autoimmune diseases include Addison's disease. Carff versus host disease. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple atrophic gastritis. Degenerative nervous system diseases include multiple in hypersensitivities such as those present in allergies, Type II hypersensitivities such as those present in callergies. Type II hypersensitivities such as those oused by condpasture's syndrome and Type IV hypersensitivities such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include lymphopyoliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAA67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

AAV02501-V02522, AAV02524-V02584, AAV02586-V02592 and AAV02594-V02616 are DNA fragments used in an assay to determine novel transcriptional activators. The method involves the production of transcriptional activators comprising of a DNA-binding group and a 6-25 amino acid peptide that is covalently bonded to the DNA binding group and does not cepresent a fragment of a natural transcription activator. Protein-C protein interactions are identified in the assay by fusing a DNA-binding domain to a library of DNA fragments and introducing this and a fusion of carget protein and a polypeptide containing a region of Gal4 which interacts with Gal11P into a cell containing dal11P and identifying members of the library that interact with the target from activation of caranscription. Such constructs are used to activate transcription in a cell, e.g. recognizing a site close to a selected therapeutic gene).

CC Transcription can be activated without blocking other transcription and activators. They probably act by interacting with a component of the RNA polymerase II holoenzyme, Gal11, the strongest known yeast activator. Death and activators. They provides a more sensitive assay allowing detection of even weak contains a contains and a provides a more sensitive assay allowing detection of even weak contains and a processed to a more sensitive assay allowing detection of even weak contains and a contains a more sensitive assay allowing detection of even weak contains and a conta

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EXXEXEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endochelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or focetal liver kinase 1 (fit-1) (eg. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression
                                                                                                                                                                                                                                                                                                           Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present invention describes nucleic acid molecules which modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

Treating rheumatoid arthritis of an individual comprising expressing an immunologically recognizable portion of a cytokine to induce formation of anti-CK immunoglobulins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bovine; leukocyte interferon; IFN; bovine IFN-beta; porcine IFN-alpha1; porcine IFN-beta1; porcine IFN-gamma; feline IFN-beta1; rabbit IFN-gamma; non-human mammalian interferon; viral infection; malignant condition; immunosuppresed condition; immunodeficient condition; respiratory complex; interferon-alpha1; IFN-alpha1; ss.
                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method of treating rheumatoid arthritis, involving expressing in the individual an immunologically recognisable portion of a cytokine such that anti-cytokine immunoglobulins are produced, neutralising the activity of an endogenous cytokine and therefore treating rheumatoid arthritis. The present sequence is a PCR primer for the rat beta-actin cDNA described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid molecule encoding non-human mammalian interferons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Porcine interferon-alphal (IFN-alphal) expression associated DNA #2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAV48412-84 represent antisense oligonucleotides directed against transforming growth factor beta-1 (TGP beta-1). The oligonucleotides exemplify the invention. The specification describes oligonucleotides (that contain B-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive cytosines, and the ratio between residues able to form two H-bonds each colloquelectides are used to modulate expression of genes, particularly the groundleotides are used to modulate expression of genes, particularly the groundleotides are used to modulate expression of genes, particularly the groliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                    Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention describes a purified and isolated nucleic acid (I) encoding a non-human mammalian interferon (IFN) chosen from bovine leukocyte IFNs, bovine IFN-betal 1, 2 or 3, porcine IFN-alphal, IFN-betal, IFN-gamma, feline IFN-betal or rabbit IFN-gamma. A microorganism or cell culture transformed with an expression vector comprising nucleic acid encoding the non-human mammalian interferon is useful for producing a polypeptide consisting of the amino acid sequence of a non-human mammalian IFN. The non-human animal IFNs are useful in the prophylactic or therapeutic treatment of non-human animals, in particular for viral infections, and malignant, and immunosuppressed or immunodeficient conditions. Bovine IFNs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       represents an oligonuclectide used to incorporate a peptide encoding an ATG translation initiation codon, DNA encoding which is incorporated into a plasmid for expressing porcine interferon-alpha! (IFN-alpha!)
including bovine, porcine, feline, and rabbit interferons, useful for treating viral, malignant, and immunosuppressed or immunodeficient

Novel isolated DNA molecule encoding protein having biological activity of histone acetyltransferase which is useful for screening histone acetyltransferase inhibitors that serve as insecticides and acaricides.

Example B; Page 21; 61pp; English.

The invention relates to an isolated DNA molecule comprising a DNA sequence which encodes an insect histone acetyltransferase (HAT a member of the MYST family which regulates food uptake) and is either the Rotkehlchen (rot) gene or the rot CDNA, or their fragments, derivatives or allelic variants. Also included are a vector comprising the nucleic acids, a eukaryotic cell harbouring the vector or nucleic acids and an

```
biochemical activity of HAT when compared with the non-treated control biochemical activity of HAT when compared with the non-treated control brotein in presence of suitable substrate, buffer and assay conditions. The vector is useful for the recombinant production of ROT. ROT is useful for the biochemical or structural characterisation of the potential inhibitors of the encoded protein. The inhibitor, in appropriate chemical compositions, is useful for an insect controlling method based on specific inhibition or sufficient reduction of activity of the native target protein (Rotkehlchen (ROT) protein which is a HAT that belongs to the so called MAST family of HAT) in an insect. ROT protein is useful as insecticide or acaricide. The inhibitor has agrochemistry, veterinary and pharmaceutical applications. The present sequence is a PCR primer used to isolate sequence encoding the ROT protein, in this case being derived

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel remedies for the treatment of diseases containing as an active component an inhibitor of the expression or activity of hypothalamus-expressed G-protein coupled receptor 901 and for treatment of cibophobia containing as an active component a potentiator of the expression or activity of G-protein coupled receptor 901. The diseases which can be treated include obsesty, diabetes and hyperlipaemia, and cibophobia (anorexia nervosa). The present oligonucleotide was used in an example from the invention
                                                 The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human Smad6 protein, which specifically hybridises with the nucleic acid and inhibits its expression. Antisense compounds of the invention are used for inhibiting the expression of Smad6 in cells and tissues in the treatment of a disease or condition associated with Smad6 such as cardiovascular disease, cancer, infection and inflammation. They are also useful in the disgnostics, as research reagents, in kits and in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human Smad6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibitors of expression or activity of G-protein coupled receptor 901 for treatment of lifestyle-related diseases and cibophobia.

The invention relates to novel remedies for the treatment for anorexia and lifestyle related disorders, comprising a substance that prevents expression or function of a polypeptide having a 300 or 345 residue amino acid sequence, given in the specification. The invention further relates to a nucleic acid comprising a 1038 or 1324 nucleotide sequence, given in the specification. The novel remedies have anabolic activity and can be used to treat disorders by gene therapy or cell therapy. The remedies can be used in the treatment of anorexia and lifestyle related disorders such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       as eating disorders, obesity, diabetes and hypertension. This sequence represents a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a novel modified bacterial enzyme carboxypeptidase G2 (CPG2). The modified enzyme can result in CPG2 proteins that are substantially non-immunogenic or less immunogenic than any non-modified CPG2 having essentially the same biological specificity when used in vivo, and comprising specific amino acid residues having alterations compared with the non-modified parochial enzyme. The alterations cause a reduction or an elimination of one or more of T-cell epitope sequences, which act in the parental enzyme as MHC class II binding ligands and stimulate T-cells. The modified CPG2 enzyme and the CPG2 proteins have immunostimulant activity and may be used in enzyme therapy. The modified CPG2 enzyme may be used to induce an immune response in a human host, or as a therapeutic entity such as the gene classification of modified CPG2 enzyme having substantially no or less immunogenicity than any non-modified parental enzyme when used in vivo, and for vaccination of patients to reduce immunogenicity to CPG2 in vivo. This polymucleotide sequence represents a mutagenic oligonucleotide used in the production of a modified CPG2 gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New modified bacterial enzyme carboxypeptidase G2 (CPG2) having substantially non-immunogenic or less immunogenic than any non-modified CPG2, useful for inducing an immune response in a human host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bacterial enzyme; carboxypeptidase G2; CPG2; non-immunogenic; immunogenic; T-cell epitope; MHC class II binding ligand; immunostimulant; enzyme therapy; immune response; gene directed enzyme prodrug strategy; vaccine; enzyme; EC 3.4.17.11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Carboxypeptidase G2 (CPG2) enzyme mutagenic oligonucleotide OL589.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 18 BP; 7 A; 3 C; 3 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contexting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents, distinguishes between methylated and non methylated CpG dinucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful to describe and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PNA (peptide nucleic acid) oligomers are useful as probes for determining cytosine methylation state or single nucleotide polymorphisms. The current sequence is that of the hybridisation control colon carcinoma colon methylams. The current sequence is that of the hybridisation colon carcinoma colon methylams. The current sequence is that of the hybridisation colon carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting and differentiating between colon ceil proliferative disorders associated with a gene or its regulatory regions comprises contacting a target nucleic acid in a biological sample obtained from the subject with
                   colon cell proliferative disorder; non methylated CpG dinucleotide; cytostatic; cancer; adenoma; carcinoma; cytosine methylation state; ss;

This invention describes a novel system of screening for ligands of the bilayer membrane coupled receptor (GPCR). The method comprises a lipid bilayer membrane in which a fusion protein comprising target GPCR and Galpha i. Or Galpha is or Galpha is or Galpha 2 is embedded. The invention also discloses a second screening system where an orphan GPCR (G protein comjugation seven-transmembrane-type receptor) is used to screen compound having agonist and/or antagonist activity for the GPCR and to screen low molecular non-peptide ligands. The screening is rapid and favourable.
                                                                                                                                                                                  Screening ligands for G protein coupled receptor comprises lipid bilayer membrane containing embedded fusion protein comprising target G protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GPCR; G protein-coupled receptor; C-PLACE 1003238; ss; G16 alpha; G12 alpha; uropathic; gynaecological; GDP/GTP exchange reaction; urinary tract disease; placental disease; tonsil disease; Hisx6; linker.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel modified bacterial enzyme carboxypeptidase G2 (CPG2). The modified enzyme can result in CPG2 proteins that are substantially non-immunogenic or less immunogenic than any non-modified CPG2 having essentially the same biological specificity when used in vivo, and comprising specific amino acid residues having alterations compared with the non-modified parochial enzyme. The alterations compared with the non-modified parochial enzyme. The epitope sequences, which act in the parental enzyme as MHC class II binding ligands and stimulate T-cells. The modified CPG2 enzyme and the CPG2 proteins have immunostimulant activity and may be used in enzyme therapy. The modified CPG2 enzyme may be used to induce an immune response in a human host, or as a therapeutic entity such as the gene manufacture of a modified CPG2 enzyme having substantially no or less immunogenicity than any non-modified parental enzyme when used in vivo, immunogenicity than any non-modified parental enzyme when used in vivo,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 is polynucleotide sequence represents a mutagenicity to CPG2 in vivo.
the production of a modified CPG2 gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                          New modified bacterial enzyme carboxypeptidase G2 (CPG2) having substantially non-immunogenic or less immunogenic than any non-modified CPG2, useful for inducing an immune response in a human host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and for vaccination of patients to reduce immunogenicity to CPG2
This polynucleotide sequence represents a mutagenic oligonucleoti

The invention relates to a screening system of a ligand with respect to C -PLACE1003238 (a GPCR), where a ligand-receptor interaction promotes estivity of GDP or GTP exchange reaction of G-protein subunits comprises, a component which is a lipid bilayer membrane that contains a polypeptide having a region which is concerned in binding with guanine nucleotide in

JP2003210192-A.

G protein-coupling receptor (GPCR) of the G-protein alpha (G16 alpha or G12 alpha) subunit that belongs to the G1 family. Also included are screening a ligand (involving comparing the effect of effector when interacted with ligand in presence or absence of the test material), producing a prophylactic and therapeutic agent of diseases of the urinary tract, placenta or tonsil (involving mixing the effector and a carrier), identifying a marker substance of the disease in the urinary tract, placenta or tonsil (involving comparing the presence of ligand identified in the biological sample derived tonsils obtained from patients and normal humans), diagnosing the peptide which consists of amino acids 12-36 of C-placenta or consil and an antibody recognising the peptide which consists of amino acids 12-36 of C-placental susful in treating and preventing the disease in the tissue of urinary organ, placenta or tonsil. Hisxé fusion proteins were constructed with human G16 alpha and G12 alpha for use in the construction system. The present sequence is a Hisxé linker used in the construction of the fusion proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Capture oligonuclectide composition useful for detection of hepatitis B virus (HBV), comprising polynuclectide having HBV-complementary sequence which is immobilized on solid support.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; capture oligonucleotide; HBV; HIV-1; HCV; donated blood screening.

Microsatellite markers based on hypervariable genomic fragments, from
Triticum aestivum (wheat) or the tribe Triticeae, consist of a sequence
tagged site (STS), defined by 2 specific primers (of mean size 17-23
bases) that flank a microsatellite sequence at both ends, which can be
microsatellites are n-fold tandem repeats (n = 10 or more) of di-, tri-
cor tetra-nucleotide sequences, combination microsatellite sequences or an
imperfect sequence in which individual bases are mutated. The
cor tetra-nucleotide sequences, combination microsatellite sequences or an
imperfect sequence in which individual bases are mutated. The
cor tetraploid forms of wheat and for genetic mapping or labelling of
tetraploid forms of wheat and for genetic mapping or labelling of
corrected forms of wheat and for genetic mapping or labelling of
monogenic and polygenic properties, and for their selection; for
cor nalysing relationships and identification and plant growth. The markers can
differentiate between almost all European wheat lines and show a higher
cor degree of DNA polymorphism than known probes for the wheat genome. They
can be detected by PCR, so large numbers of samples can be analysed
can be detected by PCR, so large numbers of samples can be analysed
can be detected by PCR, so large numbers of samples can be analysed
colymorphisms are stably inherited so can also serve as genetic markers.
CAAT77003-22 and AAT77353-716 are primer pairs that define the
corrected properties and can be defined the markers.
                                                                                                                                                                                                                                                                                                                                                                                                                          Microsatellite marker, hypervariable genomic fragment, Triticum aestivum, wheat, Triticeae, sequence tagged site, STS, primer, PCR, amplify, polymorphism, genetic analysis, hexaploid, tetraploid, mapping, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primers for STS micro:satellite markers for wheat and related species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful for genetic mapping, analysis and labelling etc. of wheat

Query Match

The invention relates to a capture oligonucleotide composition comprising an hepatitis B virus (HBV)-complementary sequence polynucleotide immobilised to a solid support. The composition is useful for detecting nucleic acids of HBV and/of HTV-1 and/or HCV in biological sample such as blood, serum, plasma or other body fluid or tissue to be tested. The composition can be used either in diagnostic application or for screening donated blood and that products or other tissues that may contain infectious particles. The composition facilitates detection of very low levels of HBV nucleic acids. The composition allows selective detection

Adhalin belongs to the sarcolemmal complex of dystrophin-associated proteins. Mutations in the adhalin protein are one of the causes of muscular dystrophy. A new method for the detection of a mutation in the human adhalin gene, comprises incubating a sample with a nucleic acid probe (e.g. AAV22617). The probe specifically hybridises to the mutant form of the gene but not the wild type. Any specific hybridisation is then detected. The method is useful for detecting mutations in the human adhalin gene which lead to primary adhalinopathy, a Duchenne-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genetic detection of primary adhalinopathies - using nucleic acid probes which bind to mutant adhalin genes but not the wild type gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Adhalin gene fragment where muscular dystrophy causing mutation occurs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; adhalin gene; dystrophin-associated protein; muscular dystrophy; detection; mutation; primary adhalinopathy; Duchenne-like autosomal recessive muscular dystrophy; probe; ds.

```
This sequence represents a primer used in the method of the invention for the detection of the presence or absence of chromosomal abnormalities, cach abnormality being associated with a condition in a subject and each being defined by at least one characteristic nucleic acid sequence. The method comprises: (a) obtaining a sample of nucleic acids derived from a subject which may harbour one of the chromosomal abnormalities; (b) subject which may harbour one of the chromosomal abnormalities; (b) procedure, where a number of the characteristic sequences; (b) procedure, where a number of the presence and/or absence of a namplicon characteristic of the abnormal sequences to detect the presence of characteristic of the abnormal sequences to detect the presence of characteristic of the abnormal abnormalities; where the MMA concessing the presence of detecting the presence of detecting the presence of the primers defining an end of at least one characteristic nucleic acid sequence, and where at least one of the primers defines the first end of at least two characteristic nucleic acid sequences each being determined in their opposite ends by MDP selected from the remainder of the MDP The methods can be used for detecting chromosomal abnormalities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   associated with diseases including numerous leukaemia's, lymphoma's, carcinoma's, adenocarcinoma's, sarcoma's, glioma's, neuroblastoma's, medullablastoma, malignant melanoma, and malignant neoplastic conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynuclectide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nuclectide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnossis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its of the organ. A need exits for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yeast; PCR primer; URA3; chromosomal rearrangement; double strand break;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exits for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and detection of prostate cancer, and the arisk of developing it in the future, and can also be used to determine therapies for the disease

            Intron-based assay for detecting chromosomal rearrangements in eukaryotic cells, by engineering the cells to contain a selectable marker gene with a site for generating a double strand break within the intron of the
                                                                                                                                 The present invention relates to an assay for detecting chromosomal rearrangements (CR) in eukaryotic cells. The assay comprises engineering the cell to contain a selectable marker gene with a site for generating adouble strand break (ds break) within an intron of the cell; generating the ds break; detecting cells which repair the ds break; isolating DNA from the detected cells, and characterising the CR. The present sequence is a PCR primer for yeast URA3; which was used in the present invention to construct a URA3: actin intron::HO cut site yeast strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a collection of binding groups for a family of nucleic acide comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for determining or typing samples, has groups capable to identify essentially nucleic acids of relatively high

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for orientation-directed construction of a construct comprising at least two nucleic acid segments of interest. The method involves performing polymerase chain reaction (PCR) amplification reaction using the combined ligated sequences as template and specific enrichment primers directing the PCR amplification towards the desired orientation where each combined ligated sequence is amplified in a separate reaction creating a combined ligated sequence is amplified in a separate reaction creating a combined product having phosphorylated blunt ends. The method is useful for generating constructs or genetic bNA construct having at least one mutation. The present sequence is a PCR primer used to create constructs using the orientation enrichment
               comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polymerase chain reaction amplification using combined ligated sequences as a template and enrichment primers directing the amplification towards

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for orientation-directed construction of a construct comprising at least two nucleic acid segments of interest. The method involves performing polymerase chain reaction (PCR) amplification reaction using the combined ligated sequences as template and specific enrichment primers directing the PCR amplification towards the desired orientation where each combined ligated sequence is amplified in a separate reaction creating a combined product having phosphorylated vectors specifically for orientation. Airected constructs or genetic vectors specifically for orientation. The present sequence is a DNA fragment used to illustrate the orientation enrichment reaction (ORR)
                                                                                                                                                                                                                                                                                                                                                                                               Orientation-directed construction of a construct comprises performing polymerase chain reaction amplification using combined ligated sequences as a template and enrichment primers directing the amplification towards
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                               construction; orientation enrichment reaction;
                                                                                                                                                       DNA fragment II used to illustrate the OBR method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

The method involves performing polymerase chain reaction (PCR) amplification reaction using the combined ligated sequences as template and specific enrichment primers directing the PCR amplification towards the desired orientation where each combined ligated sequence is amplified in a separate reaction creating a combined ligated sequence is amplified blunt ends. The method is useful for generating constructs or genetic blunt ends. The method is useful for generating constructs or genetic blunk construct having at least one mutation. The present sequence is a PCR primer used to generate poDNAPKRMt construct using the orientation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Orientation-directed construction of a construct comprises performing polymerase chain reaction amplification using combined ligated sequences as a template and enrichment primers directing the amplification towards
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
  to generate pcDNAPKRwt construct using the OER method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

(GENO-)

```
The invention relates to a method for screening compounds for their ability to modify the binding of G protein-coupled receptor protein GPR7 to its polypeptide, ligands and their amides, esters and salts, by measuring the binding in the presence and assence of the test compound. The method is used for prevention and treatment of cibophobia, anorexia, loss of appetite, excessive appetite and a broad range of obesity-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening compounds that modify the binding of G-protein coupled receptor GPR7 to its ligands for treatment of obesity and cibophobia.
                                                                                                                                                                                                                                         The invention describes an isolated and purified polypeptide, comprising an amino acid sequence encoded by exon 16 of the myotonic dystrophy protein kinase (DMPK) gene. The invention is used to detect presence or risk of myotonic dystrophy. Myocardial infarction or a condition associated with muscle damage or dysfunction. This sequence represents a mutant of the CTG repeat isolated from the 3' UTR of the novel Mytonic dystrophy protein kinase (DMPK) isoform gene that results in supression of splicing into the 3' splice site of the gene
                                                                    A new isoform of myotonic dystrophy protein kinase includes a sequence encoded by exon 16 of the gene and is useful to detect presence or risk of myotonic dystrophy, myocardial infarction or a condition associated with muscle damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                G protein-coupled receptor; GPR7; primer; 88; anorectic; cibophobia; anorexia; appetite loss; excessive appetite; obesity.related disorder; addipocyte malignancy; obesity; excessive insulin; blood volume change; thyroid disorder; paediatric obesity; upper body obesity; dietary obesity; cardiac obesity; whole body adipocyte disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0.4%; Score 14.8; DB 1; Length 19; 88.9%; Pred.                                                                                                                                                                                                                                                                                         The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell conferration Nos. are mixed clones of the specified discrimination Nos second to discrimination Nos are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the calcultant cultures are amplified by using the above primer; (g) signals and laters are specified from the amplified products; (h) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed clones are reconstituted as the positions on the chromosome and arrayed. The mixed represent PRR primers for human chromosome 1936-35 July, and ABL45323 to ABL45334 crepresent progressent invention continued in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

disorders including adipocyte malignancy, obesity due to external factors, excessive insulin, blood volume changes, thyroid disorders, paediatric obesity, upper body obesity, dietary obesity, cardiac obssity and whole body adipocyte disorder. This sequence represents a primer used in the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel compositions for inhibiting body weight gain, for lowering body weight, for inhibiting fat weight gain, and for suppressing appetite, which contain as active component a peptide ligand (GPRBL, ADC51805) of brain origin. The compositions can be used for treatment mastocytosis, exogenous obesity, hyperinsulinemic obesity, hyperplasmic obesity, hyperplasmic obesity, hyperplasmic obesity, hypothyseal obesity, hypothyseal obesity, hypothyseal obesity, symptomatic obesity, infant obesity, upper body obesity, alimentary obesity, hypogonadal obesity, systemic mastocytosis, simple obesity and central obesity). The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition comprising peptide of brain origin binding to orphan G-protein coupled receptor GPR8 for treatment and prevention of obesity and hyperphagia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                weight; GPR8L; brain; hyperphagia; obesity; anorectic; GPR8; PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A siNA of the invention has cytostatic, immunosupressive, virucide, and anti-HIV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of sing represent siNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer or autoimmune disease, downregulates expression of the BCL2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A siNA of the invention has cytostatic, immunosuppressive, virucide, and anti-HIV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single runclectide polymorphisms). The sequences shown in ADF49273-ADF50143

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1

comprise ribonucleotides and may be double or single stranded. They comprise sense and antisenes regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants for the captering of an ariety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restension and polycystic kindney disease), inflammatory and/or allergic diseases, autoimmune diseases and transplant rejection. The siNAs are also useful for drug sorreining, diagnosis, therapeutic target identification and validation, sorreining, diagnosis, therapeutic target identification and validation, sorreining, diagnosis, therapeutic target identification and validation, and contains the sinas and some and capted contains and capted capted identification and validation, and contains the sinas are also asful for drug sorreining, diagnosis, therapeutic target identification and validation, and contains the sinas and succession and validation, and contains the sinas and succession and admits and contains the sinas and successions and admits and contains the sinas and successions and admits and contains the sinas and successions and admits and contains and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer , downregulates expression of the insulin-like growth factor-1 receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human IGF-1R-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Human IGF-1R transcript target sequence/siNA upper strand, SEQ ID NO:203.

(first entry)

12-FEB-2004

ADF31538;

...

mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human IGF-IR-targeted double-stranded siNA.

Sequence 19 BP; 4 A; 9 C; 5 G; 0 T; 1 U; 0 Other;

883333

ор

```
short interfering nucleic acid, useful e.g. for treatment and mosis of cancer , downregulates expression of the insulin-like growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; micro-RNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; short interfering interfering size interfering; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cancer; proliferative disease; restenosis; polycystic kidney disease; inflammatory disease; allergic disease; aucoimmune disease; transplant rejection; cytostatic; vasotropic; nephrotropic; antiinflammatory; antiallergic; immunosuppressive; human; insulin-like growth factor I receptor; IGF-IR; ss.
                                                                                                                                                                                                                                                                                                                                                                                        Human IGF-1R siNA lower strand, SEQ ID NO:480.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chowrira B;

The present invention describes a method for enhancing the expression of a protein of interest from Bacillus. The method comprises: (a) obtaining an altered Bacillus strain capable of producing a protein of interest, where the altered Bacillus strain has at least one inactivated chromosomal gene consisting of sbo, sir, ybc0, csn, spollSA, sigB, phrC, rapA, CssS, trpA, trpB, trpC, trpD, trpE, trpF, tdh/Kbl, alsD, sigD, prC, gapB, pckA, fbp, rocA, ycgN, ycgM, rocF, and rocD; and (b) growing the altered Bacillus strain under conditions such that the protein of interest is enhanced compared to the expression of the protein of interest is enhanced compared to the expression of the protein of interest is enhanced compared to the expression of the protein of interest is enhanced compared to the expression of the protein of interest is enhanced compared to the expression of the protein of interest in an unaltered Bacillus host strain. Also described: (1) an altered Bacillus strain comprising a chrow sigD, prpC, gapB, pckA, fbp, rocA, ycgN, ycgN, rocF, and conf. (csn, spollSA, sigB, phrC, rapA, CssS, trpA, trpB, trpC, trpD, trpE, trpF, trbP, alsD, sigD, prpC, gapB, pckA, fbp, rocA, ycgN, ycgN, rocF, and the DNA construct; (4) a host cell comprising the plasmid; (5) a method for obtaining an altered Bacillus strain with enhanced protease in an expediction; (6) a method for enhancing expression of a protease in an

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1 creeptor (IGF-IR) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They comprise sense and may be double or single stranded. They comprise sense and may be double or single stranded. They comprise sense and antisense regions, or alternatively are comprise sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits of the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms of the IGF-IR gene in cells, tissue explants or organisms or treatment of a variety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restenosis and polycystic diseases) inflammatory and/or allergic diseases, autoimmune diseases), inflammatory and/or allergic diseases, autoimmune chiseases), inflammatory and/or allergic diseases, autoimmune chiseases, inflammatory and/or allergic diseases and transplant rejection. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human BCR-targeted siRNA of the invention.

                                                                                                                                                                                                                                                                                                                          88888888888
                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to short interfering nucleic acids (siNA) which downrequlate expression of the human tumour necrosis factor (TWF) gene by MA interference. The siNas may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense conjectucle and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmedified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised, expressed from a vector of sink, and vectors that express sink. The sinks are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafte and transplants for the treatment of a variety of conditions. The TNF sinks have antibacterial, immunosuppressive, anticheumatic, antiatrhritic, anti-HIV, antipsoriatic and

may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in synthesised. The invention also relates to kits for the in vitro or in synthesised. The invention also relates to kits for the in vitro or in that express siNA. The siNAs are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. The TNE siNAs have antibacterial, immunosuppressive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Virucide; Hepatotropic; Gene therapy; 8s; short interfering nucleic acid; siNA; hepatitis B virus; HBV; RNA interference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    antifheumatic, antiathritic, anti-HIV, antipsoriatic and antitheumatic, antiathritic, anti-HIV, antipsoriatic and antiinflammatory activities. They may be used for treating septic shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and autoimmune diseases. The siMhs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TNP-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
